Is there a good text on cycle points for $GL_n(\mathbb{F}_p)$? A web-reference would be fine, too. EDIT: Thanks for all the responses. I think I'll start with the following set of references: G. D. James, A construction of non-modular representations of $GL_2(p)$, Math. Proc. Cambridge Phil. Soc., 111(1992), 355-358 J. P. Serre, Lectures on ${\mathbb F}_p$-representations of $GL_2(F_p)$, Local fields and their extensions, George A. Miller ed., Graduate texts in Mathematics, vol. 29 (Am. Math. Soc., Providence, R.I., (1975),x+283) R. A. Wilson, Cyclic vectors for p-modular representations, Math. Proc. Cambridge Phil. Soc., 113(1993), 117-132 A: In the book Representations of Finite Groups of Lie Type, Richard Carter, Robert Wilson, and Gavin Robson, eds., London Math. Soc. Lecture Note Ser., vol. 155, Cambridge University Press, Cambridge, 1990, pp. 189-190, is an extensive list of references including explicit statements of theorems. There are some useful articles in the Amer. Math. Monthly: S. D. Smith, Representations of the General Linear Groups over Finite Fields, No. 64, Nov. 2001 S. D. Smith, The cyclic elements of the general linear groups over finite fields, No. 76, Dec. 2002 If you want to work over fields where p is not a good prime, there's a recent paper of mine, available as arXiv:1009.5675, that develops the theory of matrix-valued irred 82157476af
